

VMware vSphere 4 Features and Benefits Compared to Microsoft Hyper-V and Citrix XenServer

VMware vSphere – The best platform for building cloud infrastructures

VMware vSphere™, the industry's first cloud operating system, leverages the power of virtualization to transform datacenters into dramatically simplified cloud computing infrastructures and enables IT organizations to deliver the next generation of flexible and reliable IT services, using internal and external resources, securely and with low risk. VMware vSphere is comprised of the following groups of components:

Infrastructure services – The set of components that comprehensively virtualize server, storage and network resources, aggregate them and allocate them precisely on demand to applications based on business priority.

Application services – The set of components that provide built-in service level controls to all applications running on VMware vSphere, regardless of application type or operating system.

Administration of infrastructure and application services and automation of day-to-day operational tasks with deep visibility into every aspect of large and small VMware vSphere environments is provided by VMware vCenter™¹ Server.

Key Features and Benefits Comparison to Competing Virtualization Products

VMware vSphere features and benefits, including many new innovations, put it far ahead of competing products from Microsoft and Citrix. Even when compared to promised future versions of Microsoft and Citrix products, vSphere capabilities are clearly greater, as shown in the table below.

NOTE: Microsoft capabilities are based on features advertised for Hyper-V R2 as managed by System Center Virtual Machine Manager 2008 R2, both future releases. Citrix capabilities are based on XenServer 5.5 managed by Citrix Essentials for XenServer, currently in beta.

¹ VMware vCenter Server is an essential requirement for management of VMware vSphere environments and is separately purchased.
